

**Within-Channel Vegetation Survey  
Little Topashaw Creek Stream Corridor  
Rehabilitation Project**

**Spring, 1999**

**Sara Davis**

## **Objective:**

The objective of the Little Topashaw Creek vegetation study was to document the current vegetation present within the proposed restoration channel banks.

## **Methods:**

The floristic survey conducted in the 1999 growing season consisted of two components:

1. Establishment of 10 transverse transects extending between the top creek bank edges. Ten transects are located along the NRCS surveyed benchmarks numbered as LT#5 (sampled 8-11-99), LT#6 (sampled 8-11-99), LT#7 (sampled 8-11-99), LT#8 (sampled 8-11-99), LT#9 (sampled 8-11-99), LT#10 (sampled 8-13-99), LT#12 (sampled 8-13-99), LT#13 (sampled 8-13-99), LT#17 (sampled 8-11-99), and LT#18 (sampled 8-11-99). Standard collecting procedures were followed for unknown species. Specimens were carefully collected and labeled before placement in polyethylene bags in the field, then transferred to plant presses. Pressed specimens were dried for a minimum of 48 hours over portable driers using 60 watt incandescent bulbs as a heat source. Species identifications were made in the field or from dried specimens and carried to the species level only if there was sufficient material to do so (Radford et al. 1968). The numbered specimens are filed by family name in preparation for mounting and herbarium storage in the laboratory of Dr. C. M. Cooper, USDA ARS, Oxford, Mississippi, USA. Species composition and percent cover were recorded using quarter meter square quadrats every five meters along each transect. Species composition was determined by identifying all species within each quadrat (Radford et al. 1968) and along each transect. Species richness was calculated as the total number of species present within each transect (Barbour et al. 1987). Species percent cover was determined by the visual estimate of the percentage of the quadrat occupied by a given species (Barbour et al. 1987).
2. Documentation of vegetation present on six sandbars proposed for willow planting. Sandbars were sampled using 10x10 square meter quadrats. The six

sampled sites were located in reference to the NRCS surveyed benchmarks as: 11.4 meters south of LT#5 (east, sampled 8-13-99), LT#6 (east, sampled 9-14-99), 43.1 meters south of LT#8 (east, sampled 9-14-99), LT#10 (east, sampled 9-14-99), LT#13 (west, sampled 8-13-99), and LT# 19 (west, sampled 8-13-99). Species composition and percent cover were recorded within each quadrat.

## **Results**

Results of the floristic study have revealed 18 different vascular plant families with 51 different species (Appendix A). Appendix B displays the species collected by transect/quadrat location. Little vegetation was found along the streams edge, as evident by the low frequency and percent cover values. Of the vegetation present most species were opportunistic, commonly found along stream edges within this geographic region. Further up the bank the herbaceous vegetation is compatible with herbaceous vegetation in the adjacent fields, suggesting seed dispersal from the fields. The sandbars were found to be slightly vegetated. The *Salix nigra* sampled on the sandbars are possible representative of an attempt for early second succession.

## Appendix A

Genus/species	Common name	Family
<i>Acer negundo</i>	box elder	Aceraceae
<i>Alnus serrulata</i>	alder	Betulaceae
<i>Ambrosia artemisiifolia</i>	common ragweed	Asteraceae
<i>Arundinaria gigantea</i>	cane	Poaceae
<i>Betula nigra</i>	river birch	Betulaceae
<i>Campsis radicans</i>	trumpet vine	Bignoniaceae
<i>Cenchrus tribuloides</i>	sandspur	Poaceae
<i>Chamaecrista fasciculata</i>	partridge pea	Fabaceae
<i>Cirsium discolora</i>	field thistle	Asteraceae
<i>Commelina sp.</i>	dayflower	Commelinaceae
<i>Croton capitatus</i>		Euphorbiaceae
<i>Cyperus sp.</i>	sedge	Cyperaceae
<i>Digitaria sp.</i>	crab grass	Poaceae
<i>Eleocharis obtusa</i>	spike rush	Cyperaceae
<i>Elephantopus carolinianus</i>	elephant's foot	Asteraceae
<i>Eupatorium capillifolium</i>	thoroughwort	Asteraceae
<i>Galium sp.</i>	bedstraw	Rubiaceae
<i>Hydrangea styraciflua</i>	oak-leaf	Hydrangeaceae
<i>Ipomoea coccinea</i>	morning glory	Convolvulaceae
<i>Juncus effusus</i>	rush	Juncaceae
<i>Lamium purpureum</i>	henbit	Lamiaceae
<i>Leersia oryzoides</i>	cut grass	Poaceae
<i>Lespedeza virginica</i>		Fabaceae
<i>Liquidamber styraciflua</i>	sweet gum	Hamamelidaceae
<i>Lonicera japonica</i>	Japanese honeysuckle	Caprifoliaceae
<i>Ludwigia palustris</i>	floating primrose	Onagraceae
<i>Mitchella repens</i>	partridge berry	Rubiaceae
<i>Neptunia lutea</i>	sensitive plant	Mimosaceae
<i>Oenothera sp.</i>	evening primrose	Onagraceae
<i>Oxalis dillenii</i>	wood sorrel	Oxialdaceae
<i>Panicum dichotomifolia</i>		Poaceae
<i>Panicum sp.</i>		Poaceae
<i>Parthenocissus quinquefolia</i>	Virginia creeper	Vitaceae
<i>Paspalum fluitans</i>		Poaceae

<i>Platanus occidentalis</i>	sycamore	Platanaceae
<i>Poaceae sp.</i>		Poaceae
<i>Polygonum procumbens</i>	knotweed	Polygonaceae
<i>Polygonum sagittatum</i>	jewel weed	Polygonaceae
<i>Populus alba</i>	white poplar	Salicaceae
<i>Pueraria lobata</i>	kudzu	Fabaceae
<i>Quercus nigra</i>	water oak	Fagaceae
<i>Rhus glabra</i>	common sumac	Anacardiaceae
<i>Rubus allegheniensis</i>	blackberry	Rosaceae
<i>Salix nigra</i>	black willow	Salicaceae
<i>Smilax bona-nox</i>	greenbriar	Liliaceae
<i>Solidago sp.</i>	goldenrod	Asteraceae
<i>Solidago nemoralis</i>	goldenrod	Asteraceae
<i>Spiraea tomentosa</i>	hardhack	Rosaceae
<i>Toxicodendron radicans</i>	poison oak	Anacardiaceae
<i>Trichostema dichotomum</i>	blue curl	Lamiaceae
<i>Vitis rotundifolia</i>	muscadine	Vitaceae

## Appendix B:

Survey Date: 8-11-99	Frequency	% Cover	Species Composition
